

[illegible]

For every $\epsilon > 0$, there exists a $\delta > 0$ such that if $|x - y| < \delta$, then $|f(x) - f(y)| < \epsilon$.

A black and white photograph of a rectangular piece of graph paper with a grid of squares. The paper is oriented horizontally. In the bottom right corner, there is a small, irregularly shaped area that has been shaded or filled in, possibly representing a geographical feature like a lake or a building. The grid lines are thin and dark, and the paper has a slightly textured appearance.

The image shows a document page with a grid of small, illegible characters or symbols. The page is divided into sections by horizontal and vertical lines. The top section is the largest, followed by a smaller section below it, and then a section at the bottom right. The characters appear to be arranged in rows and columns, possibly representing a data table or a code.
